

15.0 CONCLUSIONS AND RECOMMENDATIONS

The SAN SWMP describes the procedures and activities intended to manage and reduce urban runoff pollution to the storm drain system, and ultimately San Diego Bay, from the operations and activities at SAN. This document was prepared by the Authority consistent with the Municipal Permit and the General Industrial Permit to provide a written account of the actions undertaken to comply with the requirements of these two permits. This SWMP contains the information required by the Municipal Permit for each component of the Authority's stormwater management program, specifically: land-use planning for new development and redevelopment, construction activities, existing development, illicit discharge detection and elimination activities, education activities, and public participation activities.

Any recommendations for future actions and/or program additions and/or revisions will be presented in the Annual Reports required by both the General Industrial Permit and the Municipal Permit.
